一. 中文計畫摘要:

本計畫主要工作是設計與開發新型的陽離子性奈米樹狀體-抗體載體，使我們發展更精準之非病毒性導向式基因傳送系統。本計畫的目的有四:(1)設計與合成抗體-陽離子性奈米樹狀體。(2)針對DNA/抗體-陽離子性奈米樹狀體載體複合體結構改變，其物化性質(複合體粒徑大小、表面電荷)的改變。(3)偵測 Fc 接受器之專一性。(4)探討抗體-陽離子性奈米樹狀體之細胞毒性與陽離子性奈米樹狀體表面正電胺基消耗之間的相關性。

二. 英文計畫摘要:

The proposed project is to design and develop the novel type of antibody-conjugated cationic dendrimer for targeted gene delivery. The aim of this study consists of : (1) design and chemical synthesis of antibody-conjugated cationic dendrimer; (2) characterization of chemical-physical properties including size and surface charge of cationic dendrimer/DNA complexes with/without antibody conjugation; (3) measurement of specificity of Fc receptor with antibody-conjugated cationic dendrimer; (4) relationship between cytotoxicity and assumption of surface amine groups in cationic dendrimer.

三. 計畫緣由與目的:

陽離子性奈米樹狀體(dendrimer)又被歸類為高分枝分子(hyperbranched molecules)，其特殊之球型結構，使其具備有特別之性質，亦為本研究目標，這方面研究已成為生物科技與奈米材料整合領域之新焦點[1]。

Polyamidoamine(PAMAM)與
polypropylenimine dendrimers [2,3]為文獻中常用之非病毒性載體，在體外及體

內有極佳之轉染效率。樹狀體很容易透過分子設計結構，分子量分佈非常狹窄(低 polydispersity)，同時擁有大量的末端官能基，可供連結其他有功能性之官能基於球體表面，因此近來對其應用於非病毒性基因治療之研究越來越引起注意。雖然陽離子性高分子/DNA 複合體可達成細胞轉染，然而其帶正電荷之特性，使得與帶負電之細胞膜作用，欠缺專一性，因此為了在體內之應用能順利進行，許多研究嘗試將具有導向性的配位體(ligand)鍵結於高分子載體中，以達成特殊細胞導向功能，以期能提高其專一性。配位體一般利用細胞膜上之接收器(receptor)互相結合的特性，使得增進複合體細胞內吞作用，以增進轉染效率，此一輸送機轉乃利用病毒及致毒素侵入細胞之作用，同時一些大分子如養分(LDL, transferrin)，生長因子及荷爾蒙(胰島素、VEGF、EGF、FGF)進入細胞內亦利用接受器之作用機轉，一般配位體可為蛋白質、peptide、糖類、維他命或抗體[4]。一般接受器作用機轉，提高細胞轉染效率需具備下列條件：接受器在目標細胞表現的量需足夠，配位體與接受器之親和力必須具備專一性及接收器配位體接合後需配合細胞內吞作用，進入細胞膜內部。雖然配位體被利用之中種類眾多，其中以抗體之專一性最為顯著[5]，例如 transferrin 接受器在很多細胞中都可以發現，使得其專一性大大降低。然而，相較於其他配位體，抗體-陽離子性高分子用於高分子傳送系統之研究仍屬萌芽摸索階段，充分瞭解其特性並應用此技術，可使我們發展更精準之基因傳送系統。目前以抗體鍵結於奈米樹狀體(PAMAM)表面的研究主要是增加自我辨認(self-recognition)功能，應用於藥物治療、診斷與偵測、仿生感測等領域[6-8]。AstraZeneca

公司宣稱其抗體鍵結奈米樹狀體(PAMAM)可應用於導向式藥物傳送系統，藥物之毒性大為降低 [9]。所以利用這一特點，從事具自我辨認或導向式性質的陽離子性奈米樹狀體與抗體的合成與設計，載體之細胞毒性伴隨陽離子性奈米樹狀體表面正電胺基消耗可望降低，並且基因傳送之專一性因抗體之共價鍵鍵結而提高，也將是本計畫的理想目標。

四. 研究方法:

1. 化學合成抗體(IgG)-陽離子性奈米樹狀體(PAMAM 5.0)(PAMAM-IgG):

反應步驟簡述如下：

2. 製備載體/DNA複合體

製備載體/DNA 複合體時，必須將在適當條件(w/w ratio)下載體之水溶液(1500 μ L)緩慢加入 DNA 水溶液(1500 μ L；10 μ g/mL)，以確保載體/DNA 複合體的適當粒子大小，然後均勻混合 1min.，靜置 30 分鐘後(time for complex formation)以得到載體/DNA 複合體。

3. 電泳法(0.7% agarose gel)檢視製備DNA (凝膠中之位置及 band 大小)的三級結構(tertiary structure)。

4. 細胞毒性測定: 細胞於培養 48 小時後，以加入 XTT(sodium 3'-[1-(phenylamino-carbonyl)-3,4-tetrazolium] bis (4-methoxy-6-nitro)benzene sulfonic acid hydrate) reagent 測定。因活細胞中的粒腺體中的去氫酶 dehydrogenase，會將 XTT reagent 中的 tetrazolium 轉變成橘色的 formazan，再以分光光度計比較由活細胞的標準曲線計算而得。

5. 細胞基因轉染: 在不同的條件下複合體(DNA/抗體-陽離子性奈米樹狀體載體複合體與 DNA/陽離子性奈米樹狀體載體複合體)加至細胞培養盤(flat-bottom 24-well plate；60-75% confluence； 3×10^4 cells/well)於 37 °C；5% CO₂ 細胞培養箱中作用 4 小時，進行基因轉染，4 小時後更換培養液細胞繼續在培養箱中生長 48 小時，最後測定 pSG5lacZ 基因在細胞之表現；此基因之表現產生 β -galactosidase 酵素。以 o-nitrophenyl- β -D-galactopyranoside (ONPG)作為 β -galactosidase 基質測定分光光度計(420 nm)黃色的吸收，再比較 β -galactosidase 標準曲線計算而得。比較不同載體在細胞株中基因轉染活性。

五. 結果與討論:

1. The dendrimer conjugate (**PAMAM-IgG**) was confirmed by pyridine-2-thione assay by adding DTT to the conjugate and recording the absorbance of the released 2-thiopyridine at 343 nm.
2. Band retardation of DNA/PAMAM-IgG complexes is shown in Figure 1. DNA showed the complete retardation at weight ratios of DNA/PAMAM-IgG above 1:3, indicating that DNA formed positively charged complexes with PAMAM-IgG above 1:3 weight ratios. The mean particle size at weight ratio of DNA/PAMAM-IgG above 1:3 is 210- 280 nm.
3. The cytotoxic effect of PAMAM and PAMAM-IgG in cultured RAW 264.7 murine macrophage-like cells was determined by a tetrazolium salt (Figure 2). Viability reduced dramatically with increased dosage of PAMAM. Macrophages appear to be sensitive to PAMAM. However, higher dosage were required for PAMAM-IgG to induce cytotoxic effect. These results indicated that PAMAM treatment damaged the macrophages more than PAMAM-IgG.
4. In vitro β -galactosidase gene expression after transfection for 24 h on RAW 264.7 cells was shown in Figure 3. The gene expression levels obtaining using DNA/PAMAM-IgG (1: 4 w/w) were significantly higher than those obtained with DNA/PAMAM (1: 4 w/w). However, the DNA controls exhibited no significant increase in gene expression levels over the background level.
5. The effect of specific and nonspecific inhibition for Fc receptor on gene expression mediated by

DNA/PAMAM-IgG (1: 4 w/w) was evaluated in Figure 4. Increasing competition of the Fc receptor by adding IgG (0.1 – 10 mg/ml) resulted in a decrease in the level of gene expression. However, bovine serum albumin (nonspecific competition) had no effect on gene expression levels. The results supported the gene delivery to RAW 264.7 cells via receptor-mediated endocytosis.

六. 計劃成果自評：

In the current study, we report a novel dendrimer delivery carrier that utilizes Fc receptor-mediated endocytosis as a mean to target DNA to the macrophages. This novel carrier employs molecular conjugates consisting of antibody (IgG) covalently-linked to cationic dendrimer. Effectively gene expression was demonstrated and specific internalization of the complexes by Fc receptor pathway was confirmed by competitive inhibition using excess IgG. The conjugates was also found to be less toxic in macrophages as compared dendrimer alone, suggesting its potential safty in vivo.
